Hello,

If you are experiencing issues with the package, please clarify the nature of the error or provide visual materials (**screenshots of all console errors**) so that I can promptly make the necessary corrections.

Please also take note of the correct procedure for testing the project:

1. Unity Version. As specified in the technical details, the project must be opened in **Unity 6000.0.59f2**.
   https://unity.com/ru/releases/editor/whats-new/6000.0.58f2#installs

2. **Create** new project must be created specifically in this version. The project type should be **Universal 3D (URP)**.

3. Asset Import. Import the provided **.unitypackage** file. Drag and drop into the Asset folder.

4. Import Settings. During the import process, Unity may prompt to apply project settings or install dependencies — all prompts **should be accepted**.

5. Platform Selection. In File → Build Profiles, switch the target platform from Windows to **Android**.

6. Scene Registration. In File → Build Profiles → Scene List, **add** the following scenes: **Bootstrap** and **Level**.

First Launch. On the first launch, the game's user interface may be non-interactive. This is caused by the import process of the .unitypackage file — after the import, a project restart is required for all components to initialize correctly. **After restarting**, the interface and functionality should work properly.

I am attaching a video tutorial of the import process
